I can only guess that they might not have electricity. Or, that their eyes are more light sensitive than ours and their dim lights don't show up well. While the one picture does look like a house, I don't see any neon signs, street lights, parking lamps or other bright lights that would be noticeable from Outer Space.

Just because they are Alien doesn't mean they are more advanced.

That was on Earth and these pictures are of Mars. Mars is farther from the Sun, colder, and may have a much diminished food supply. Not long ago, humans here on Earth averaged 5 feet or so. Today, 6 feet is close to norm.

Also, according to the scientists, the atmosphere is carbon dioxide.

While 'adaptation' may have enabled them to separate off the two oxygen molecules, it might be a less efficient process than directly absorbing oxygen from the air. If they do absorb oxygen from CO<sub>2</sub> then they probably cough up black carbon from time to time.

It could be you aren't using contrast and brightness alteration to see within the dark, almost black, Martian shadows. Also, resizing — or increasing resolution as it is sometimes called — may allow for more sharply defined enlargements.

Re: Go To Mars?

I have just added a stunning new picture to Star Dot Blog:

<http://stardot.blogspot.com/>

There are now 4 of the pictures that I have resolution increased, brightened, and cropped. The new pictures show what appear to me to be animals as well as a . . . Martian! But, as you have pointed out, the pictures have been enlarged to the point of blurry images.

See for yourself. Rest assured that I have not 'faked', 'altered' (other than stated above), or 'blended' these photos in any way. They may be fuzzy, but they are not phoney.
