Hi, I would appreciate any help I can get to be able to calculate the Ranked Probability Skill Score (RPSS) for my simulations.

I have produced deterministic simulation results (10 different runs for the same input) which I want to compare to observed data. I have to do this probabilistic. I will first transfer the simulations into 3 categories (below, above and normal). After that I will calculate the RPSS. But at the moment I have not solved how this is supposed to be done. Can anybody help me with this?

I would appreciate any help I can get in form of a MATLAB file (or any other program code) or just a description of the steps that I will do to calculate the RPSS.

Best regards

Patrik
