A provisional list of the JR critical values:

Using

www.itl.nist.gov/div898/handbook/eda/section3/eda35b.htm

and the formula provided by the Marco.

__ n	c.v.	95%	99%
__ 30	4.02		10.28
__ 35	4.22		10.72
__ 40	4.41		11.14
__ 45	4.55		11.38
__ 50	4.65		11.57
__ 55	4.76		11.73
__ 60	4.84		11.86

(frequencies based on 1million of samples for each size).

Comment

Marco, can you show me a more puerile-imbecile task than to provide an *infinite* number of decimal places concerning an erroneous approach, as chi-square (2 df) is to the JR statistics (Reef Fish gave)?
