I have two non-increasing monotonic time series curves. How does one go about deciphering the point at which they intersect?

Any references: articles, books etc. would be useful.

Raphael

R.

Very interesting problem. I might be interested in examining the "curves" or better yet the actual data used to construct "the curves". I would think that the two predictive equations could be solved to identify possible intersect points..... If you wish you can either post the data or a web-site where the data exists ...or send it directly to me.
