

"Junior" Pocket Microscope From Germany?

Source: <http://sci.tech-archive.net/Archive/sci.techniques.microscopy/2008-10/msg00021.html>

I don't recall if I saw a lead to this scope in this ng, or elsewhere, but today I found a German microscope that was stamped "Junior" on the case. It fits into a cylindrical brass case (about 40mm dia. x 140 mm long), and when set up it rests on three legs that screw into the supporting body. The single objective is actually 3 lenses that can be unscrewed individually (like removing the top lens from a condenser). The ocular has a "3" engraved on it.

With all 3 objective elements attached, the magnification is around 100x. The images are pretty good for such a small device. The only issue I have with it is that I can't find a way to remove the tube lens to clean the lower surface.

I would post a picture of it, but don't have a site handy for that purpose. Has anyone got any information about this scope? Age, manufacturer, etc?

Thanks,
Joe
